

1. A rotary shelf [assembly] mechanism comprising: a [telescopically adjustable vertical] post [arrangement]; first and second mounting brackets [spaced apart from and opposing each other] supporting the post [arrangement]; at least one [single piece] shelf connected to the post [arrangement], the post [arrangement] having pin-receiving apertures proximate the at least one connected shelf, each of the at least one shelf having a [post-securing section including a hub with a] post-encircling sleeve [disposed within and spaced from the hub;] including [a] an operatively connected pin-receiving indent [operatively connected with the post-encircling sleeve] ; and a pin extending through the post [arrangement] pin-receiving apertures and being cooperatively received [and retained] by the pin-receiving indent of the at least one shelf [and through the post-encircling sleeve] to secure the at least one shelf to the post arrangement so that the post arrangement and the shelf rotates as one unit.

2. The mechanism as claimed in claim 1 wherein the pin is an elongated element having first and second ends and the pin-receiving indent engages at least one of the pin ends when the pin operably secures the at least one shelf to the post [arrangement].

3. The mechanism as claimed in claim 1 wherein the [hub] post-encircling sleeve of the at least one shelf has a post-receiving opening, the pin-receiving indent is a rectangularly shaped recess communicating with the post-

receiving opening, the post [arrangement] further including pin-receiving apertures at each of a plurality of shelf positions.

4. The mechanism as claimed in claim 3 wherein the pin is an elongated element having first and second ends and the pin-receiving indent engages at least one of the pin ends when the pin operably secures the at least one shelf to the post [arrangement].

5. A rotary shelf mechanism comprising: a post; at least one shelf connected to the post, the post having pin-receiving apertures proximate the at least one connected shelf, each of the at least one shelf having a post-encircling sleeve including an operably connected pin-receiving indent; and a pin extending through the post-receiving apertures and being cooperatively received by the pin-receiving indent of the at least one shelf to secure the at least one shelf to the post.

6. The mechanism as claimed in claim 5 wherein the pin is an elongated element having first and second ends and the pin-receiving engages at least one of the pin ends when the pin operably secures one of the pin ends when the pin operably secures the at least one shelf to the post.

7. The mechanism as claimed in claim 5 wherein the post-encircling sleeve of the at least one shelf has a post-receiving opening, the pin-receiving indent is a rectangularly shaped recess communicating with the post-receiving

opening, the post further including pin-receiving apertures at each of a plurality of shelf positions.

8. The mechanism as claimed in claim 7 wherein the pin is an elongated element having first and second ends and the pin-receiving indent engages at least one of the pin ends when the pin operably secures the at least one shelf to the post.

9. The mechanism as claimed in claim 5 wherein the post is vertically adjustable.
